

REQUIREMENTS FOR THE TRANSPORTATION OF ANIMALS

Kalashnikova M. A., Radziuk A. A., students
Scientific supervisor – Slesarenok E. V., senior lecturer
Belarusian National Technical University
Minsk, Republic of Belarus

Today, not all logistics companies are engaged in the transportation of animals, let alone exotic ones. Since such transportation requires a lot of effort and must be calculated to the smallest detail. To ensure the most correct transportation of exotic animals, you should pay attention to some important points. They may differ depending on the type of animal.

The requirements for the transportation of exotic animals are quite large, as they need the availability of permits and procedures. To carry out transportation, also to veterinary inspection, you will need to have standard permits and procedures, namely: an F1 certificate, a veterinary passport of an animal, chipping procedures for traveling abroad, rabies vaccination or prevention of various diseases, depending on the destination region [1].

Another important point that should be taken into account during transportation is the requirements for containers: containers must be of a closed type; the container must correspond to the dimensions of the animal; containers must be clean, dry, have the necessary number of ventilation holes. When transporting exotic animals, the logistics company must think carefully each stage of transportation in detail.

The quality of transportation and the safety of animals will depend on the correct choice of the vehicle and container for transportation. If each condition of transportation is met, the cargo/animals will be delivered on time in integrity [2].
